Trabalho de Conclusão de Curso apresentado ao curso de Bacharelado em Fisioterapia da Escola de Educação Física, Fisioterapia e Dança da Universidade Federal do Rio Grande do Sul como requisito parcial para obtenção do grau de Bacharel em Fisioterapia.

Orientadora: Cláudia Silveira Lima

Porto Alegre

2023

RESUMO

No esporte, o papel da fisioterapia na redução de risco de lesões é indispensável, cada vez mais se faz fundamental detectar padrões de movimentos alterados. A presença de valgo dinâmico do joelho em tarefas dinâmicas vem sendo associada a déficit de amplitude de movimento de dorsiflexão de tornozelo em cadeia cinética fechada (Lima et al., 2018). O presente estudo teve como objetivo correlacionar a amplitude de movimento de dorsiflexão do tornozelo com o padrão valgo dinâmico do joelho em jogadoras de futsal. Vinte e duas atletas universitárias de futsal feminino participaram do estudo. A dorsiflexão do tornozelo foi avaliada a partir do *Lunge Test* e o valgo dinâmico do joelho analisado pelo *Lateral Step Down Test*. Uma significativa correlação negativa moderada foi encontrada entre a amplitude de dorsiflexão de tornozelo em cadeia fechada e a qualidade de movimento na tarefa de descida do degrau, indicando maior deslocamento medial do joelho na tarefa. Os resultados mostraram que o padrão maior de valgo dinâmico durante a descida de um degrau tem significativa correlação com menores amplitudes de dorsiflexão de tornozelo em atletas universitárias de futsal feminino.

APRESENTAÇÃO

Minha história como atleta amadora (e as lesões que seguidamente me acompanharam) despertaram o desejo de me tornar fisioterapeuta ainda na adolescência. Porém, ao longo dos anos, a vida foi me conduzindo a conquistar outros papéis dos quais me orgulho muito, como profissional de Educação Física e professora de treinamento funcional, mas que, inevitavelmente, atrasaram meu desejo inicial. Desde a escolha pela Fisioterapia até o momento de concretização desse desejo (a chegar em 4 semanas) terão se passado quase 20 anos. Muito tempo! Mas se pudesse escolher um momento ideal para completar a graduação, por diversos motivos, escolheria esse.

Este trabalho representa muito dos últimos anos da minha trajetória profissional e acadêmica. A minha paixão pelo esporte e pelo treinamento funcional, juntamente com os avanços da fisioterapia esportiva e musculoesquelética na última década, me motivaram a escolher o tema. Fiz parte do futsal feminino universitário por muitos anos, atuo há bastante tempo na área do movimento como treinadora, tive a oportunidade de desenvolver e ministrar cursos e aulas sobre treinamento funcional, tenho imenso interesse de atuação na fisioterapia musculoesquelética e comprehendo bem o potencial que o movimento tem na vida das pessoas. Portanto, este Trabalho de Conclusão de Curso tem um pouco de cada uma das minhas versões.

Espero que o presente estudo possa auxiliar na redução do risco de lesões em atletas mulheres, e sobretudo fomentar mais pesquisas nesta área e com essa população. Visto isto, o artigo científico, oriundo deste trabalho, será submetido na revista científica *Physiotherapists in Sports Medicine*. A formatação do trabalho se dará de acordo com as normas de submissão do jornal acima citado, conforme o Anexo I.

Introdução

Na fisioterapia esportiva cada vez mais busca-se ampliar o olhar para o atleta, relacionando funções e disfunções de diferentes estruturas do corpo. Já se sabe que déficits de mobilidade articular, por exemplo, podem acarretar alterações em padrões de movimentos devido ao processo compensatório de estruturas próximas. Estes padrões de movimentos alterados podem intensificar a carga em articulações, tornando-as mais suscetíveis a desgaste e possíveis lesões (Hewett col., 2005; Rabin et al., 2014; Malloy, 2015; Sigward, 2008; Stiffler, 2018; Kaufman et al., 1999; Witvrouw et al., 2000). É imprescindível que profissionais da área compreendam essas relações, para serem capazes de propor intervenções mais assertivas para o atleta.

Algumas evidências demonstram que a diminuição da mobilidade de dorsiflexão de tornozelo em cadeia cinética fechada, por exemplo, pode ter relação com comportamento alterado do joelho, como presença de valgo dinâmico, caracterizado por um deslocamento medial acentuado do joelho em tarefas dinâmicas (Lima et al., 2018). Por sua vez, o valgo dinâmico está bem associado ao principal mecanismo de lesões no joelho, sobretudo na ruptura do ligamento cruzado anterior (Hewett col., 2005), além de ter relação com outros tipos de lesão (Rabin et al., 2014; Hewett e Myer, 2011; Malloy, 2015; Sigward, 2008). Sendo assim, a identificação da presença de valgo em atletas e a identificação das possíveis causas desse comportamento tornam-se fundamentais na tentativa de melhorar o padrão de movimento desses atletas.

Levando esta análise para o contexto do futsal e futebol feminino, percebe-se uma carência de estudos que tratem especificamente desse tema. Questão que precisa de atenção considerando que as lesões de joelho estão entre as de maior incidência nesta modalidade e população (Crossley et al., 2020; Elsner et al., 2007; Junge e Dvorak, 2004 e 2010).

É importante salientar que a dorsiflexão do tornozelo é uma característica modificável, e ao considerar o déficit neste movimento como fator de risco para lesões e redução de

desempenho, os profissionais têm a possibilidade de, ao aumentar a amplitude de dorsiflexão, regredir o quadro de uma condição já instalada, auxiliando na redução do risco de lesões e atuando no aumento do desempenho.

Portanto, este estudo teve como objetivo correlacionar a amplitude de movimento de dorsiflexão do tornozelo com o padrão valgo dinâmico do joelho em atletas de futsal feminino. Nossa hipótese é que a amplitude de dorsiflexão de tornozelo em cadeia fechada reduzida apresenta relação com a presença de valgo dinâmico no joelho em jogadoras de futsal, tendo relação inversamente proporcional, ou seja, quanto menor a amplitude de dorsiflexão maior o nível de deslocamento medial do joelho (valgo dinâmico).

Métodos

Tipo de Estudo

Esta pesquisa se refere a um estudo observacional correlacional (Thomas e Nelson, 2012). O estudo foi aprovado pelo Comitê de Ética em Pesquisa da Universidade Federal do Rio Grande do Sul, sob o número 65145722.8.0000.5347.

Participantes

Vinte e duas atletas de futsal do sexo feminino integrantes das equipes universitárias da Universidade Federal do Rio Grande do Sul (UFRGS) e da Sociedade Ginástica de Porto Alegre (SOGIPA) participaram deste estudo. As participantes não apresentavam nenhum tipo de lesão no momento da avaliação, faziam parte da equipe por pelo menos 6 meses e tinham mais de 18 anos. O recrutamento ocorreu através de contato direto com integrantes das comissões técnicas das equipes que autorizaram o contato com as atletas. O tamanho da amostra foi calculado por meio do software G Power (versão 3.1.9.1). O cálculo amostral foi realizado a partir da média e do desvio padrão da variável independente - a amplitude de dorsiflexão do tornozelo em cadeia fechada - apresentadas no estudo de Hoch e McKeon (2011). Além disso utilizou-se a equação para população infinita com nível de significância de

0,05 e margem de erro de 10%, resultando em um número amostral de 21 sujeitos (Santos, Abbud e Abreu, 2007).

Procedimentos

A coleta se deu em encontro único dos avaliadores com as atletas no próprio local de treino da equipe, sob orientação dos treinadores. Primeiramente foi explicado o estudo para a participante e apresentado o Termo de Consentimento Livre e Esclarecido. Após o aceite, a atleta forneceu dados de identificação e caracterização da amostra, e só então foram realizados os testes.

Avaliação da Dorsiflexão de Tornozelo

Para mensuração da dorsiflexão de tornozelo foi utilizado o *Lunge Test* (Bennell et al., 1998). A avaliadora fixou uma fita métrica no solo perpendicular à uma parede, e uma fita adesiva na parede formando o ângulo de 90° com a fita métrica do solo. A participante posicionou o segundo dedo sobre a fita métrica, com o pé perpendicular à parede e, em um primeiro momento, avançou o joelho à frente até que tocasse a parede, sem elevar o calcanhar do solo. Caso necessário, o pé foi progressivamente (de 1cm em 1cm) posicionado mais atrás ou mais à frente até que o joelho tocasse a parede, com o calcanhar permanecendo em total contato com o solo, essa foi a amplitude de dorsiflexão máxima atingida (Figura 1). Neste ponto máximo de amplitude a avaliadora posicionou o inclinômetro 15 centímetros abaixo na tuberosidade tibial, obtendo o ângulo de dorsiflexão do tornozelo em cadeia fechada. Além desse dado, a avaliadora registrou a distância mensurada na fita métrica, entre o segundo dedo do pé e a parede (Bennell et al., 1998).

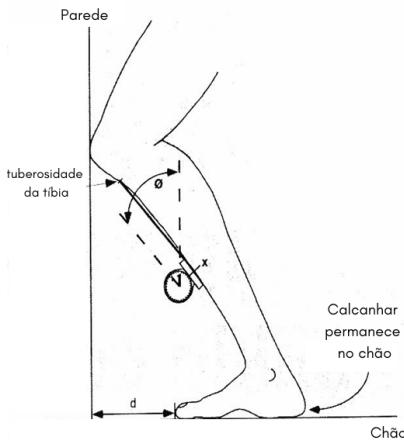

Figura 1. *Lunge Test*
(Ø: ângulo de dorsiflexão, d: distância entre pé e a parede)

Avaliação do Valgo Dinâmico

Para avaliação da presença de valgo dinâmico do joelho foi utilizado o *Lateral Step Down Test* (Piva e col., 2006). Para realização do teste a avaliadora fixou um marcador na tuberosidade anterior da tíbia da participante e marcadores próximos às bordas de um step. O segundo dedo do pé da participante foi posicionado sobre o marcador do step de aproximadamente 20 centímetros de altura. O membro inferior não testado foi posicionado lateralmente ao step com extensão do joelho e dorsiflexão do tornozelo. As mãos permaneceram posicionadas sobre as espinhas ilíacas ântero superiores durante a execução do teste. A participante realizou flexão, de aproximadamente 60°, de joelho, juntamente com flexão de quadril e tornozelo, caracterizando a descida do degrau, até que o calcanhar do membro inferior oposto tocasse no solo, sem descarregar o peso (Figura 2) e retornou à posição inicial. A participante executou uma repetição para a familiarização ao movimento, e o teste se deu por mais cinco repetições do movimento registradas através de filmagem (Piva e col., 2006).

Figura 2. *Lateral Step Down Test* (Fonte: Autora)

O teste foi filmado por câmera embutida em *smartphone* posicionada a dois metros de distância, e posteriormente, a filmagem foi utilizada para análise da cinemática do joelho durante o movimento. A pontuação do teste se deu através dos critérios apresentados pela Tabela 1. A pontuação final variou entre 0 e 6, sendo a classificação apresentada pela Tabela 2 (Piva et al. 2006).

Tabela 1: Critérios para pontuação no *Lateral Step Down Test*

Critérios	Interpretação	Pontuação
Membros Superiores	Remover as mãos da cintura	1
Alinhamento do Tronco	Inclinar em alguma direção	1
Plano Pélvico	Perda do plano horizontal	1
Posição do Joelho	TAT posicionada medialmente ao segundo metatarso	1
	TAT posicionada medialmente à borda medial do pé	2
Postura Estável	Participantes perdeu o equilíbrio ou precisou descer	1

TAT: tuberosidade anterior da tíbia

Tabela 2: Classificação do *Lateral Step Down Test*

Pontuação Final	Qualidade de Movimento
0 a 1	Boa
2 a 3	Moderada
4 a 6	Pobre

Análise Estatística

Os dados foram submetidos ao teste de Shapiro-Wilk para verificar a normalidade dos dados. Após, foi realizado a análise descritiva com valor de média e desvio padrão. Para verificar a existência de correlação entre as variáveis foram realizados os testes de correlação de Pearson (dados paramétricos) ou Spearman (dados não-paramétricos). Foi adotada, para interpretação correlacional, a classificação de Gaya et al. (2008), categorizada em muito baixa ($r < 0,2$), baixa (entre 0,2 e 0,39), moderada (entre 0,4 e 0,69), alta (entre 0,7 e 0,89) e muito alta (0,9 a 1). Os dados foram analisados por meio do software SPSS v. 20.0, adotando o nível de significância de 0,05.

Resultados

O presente estudo foi composto por 22 atletas amadoras integrantes das equipes de futsal da Universidade Federal do Rio Grande do Sul e da Faculdade SOGIPA de Porto Alegre. As médias e os desvios-padrão dos dados de Caracterização da Amostra estão descritos na Tabela 3.

Tabela 3. Caracterização da amostra expressa em média (\pm DP).

	Atletas Futsal SOGIPA	Atletas Futsal UFRGS	Atletas Futsal (Todas)
n	15	7	22
Idade (anos)	23.8 ± 6.61	20.7 ± 0.95	22.8 ± 5.62
Estatura (cm)	163.7 ± 3.57	161.5 ± 9.10	163.0 ± 5.76
Massa (kg)	63.4 ± 8.79	62.5 ± 13.46	63.1 ± 10.17
Tempo de Prática (anos)	5.6 ± 0.82	3.7 ± 2.05	5.0 ± 1.57

Os valores de médias e desvios-padrão do lado direito e esquerdo obtidos no *Lunge Test* avaliado pela distância do pé até a parede e pelo ângulo de dorsiflexão do tornozelo, assim como a pontuação obtida na execução do *Lateral Step Down Test* em cada lado estão apresentados na Tabela 4.

Tabela 4. Valores do *Lunge Test* e do *Lateral Step Down Test* expressos em média (\pm DP)

	Direito	Esquerdo
<i>Lunge Test</i> (cm)	$10,80 \pm 2,73$	$10,18 \pm 2,65$
<i>Lunge Test</i> (°)	$42,50 \pm 7,42$	$41,55 \pm 7,41$
<i>Lateral Step Down Test</i>	$1,68 \pm 0,89$	$1,59 \pm 0,96$

No que diz respeito aos dados de correlação, os valores de distância obtidos no *Lunge Test* mostraram uma significativa correlação negativa moderada com os dados do *Lateral Step Down Test* tanto para o membro inferior direito, quanto para o membro inferior esquerdo (Tabela 5). O mesmo ocorreu com os dados do *Lunge Test*, medidos pelo ângulo de dorsiflexão do tornozelo, foi encontrada uma significativa correlação negativa moderada com o *Lateral Step Down Test* tanto para membro inferior direito quanto para membro inferior esquerdo (Tabela 5). Ou seja, quanto menor a amplitude de movimento de dorsiflexão de tornozelo em cadeia fechada, menor a qualidade de movimento no agachamento unipodal.

Tabela 5. Correlação entre os dados do *Lunge Test* e do *Lateral Step Down Test*

* diferença significativa

Discussão

Os resultados do presente estudo indicam que o valgo do joelho durante a tarefa de descida do degrau tem relação com baixa amplitude de dorsiflexão de tornozelo. As atletas com menores graus de dorsiflexão em cadeia fechada apresentaram maiores pontuações ou pior desempenho no *Lateral Step Down Test*, teste utilizado para avaliar o valgo dinâmico.

A relação entre as duas variáveis contidas neste estudo é amplamente estudada na literatura em diversas populações e diferentes formas de avaliação. Uma grande revisão sistemática com meta-análise realizada por Lima e col. (2018), incluiu a análise de 17 estudos, e teve o objetivo de avaliar a associação entre dorsiflexão do tornozelo e valgo dinâmico do joelho. Os autores encontraram resultados que corroboram com os do presente estudo, que determinada limitação de dorsiflexão está associada a indivíduos que apresentam padrão valgo dinâmico do joelho. Ainda, a análise mostrou consistentes resultados em relação às diferentes formas de medida da amplitude de dorsiflexão (cadeia aberta com joelho estendido, cadeia aberta com joelho flexionado e cadeia fechada) sendo todas elas significativamente associadas ao valgo dinâmico do joelho.

Os estudos que utilizaram duas formas de avaliar a dorsiflexão do tornozelo - cadeia cinética aberta e fechada - para relacionar ao valgo dinâmico (Rabin e col., 2016; Rabin e Kozol, 2010; Dill e col., 2014; Rabin, Kozol e Spitzer, 2014), não encontraram diferença entre elas nos resultados. A escolha da avaliação em cadeia fechada, neste estudo, se deu pela maior funcionalidade do teste devido a possibilidade de aplicação de um maior torque ao tornozelo, em comparação a mensuração convencional (sem apoio do pé no solo), portanto o teste se aproxima mais de tarefas funcionais (Bennell e col., 1998), principalmente quando a população em questão é de atletas. Visto isto, todos os estudos mencionados nesta discussão tiveram a cadeia fechada como forma de avaliação da dorsiflexão.

O valgo dinâmico é caracterizado por uma adução excessiva de quadril combinada a rotação interna de quadril e de joelho, gerando assim o deslocamento medial do joelho. Portanto, é considerado um padrão modificado de movimento de membros inferiores que gera alta carga à articulação do joelho em tarefas dinâmicas (Hewett e col., 2005). O valgo do joelho é considerado fator de risco para algumas lesões, entre elas síndrome da dor patelofemoral (Rabin et al., 2014) e lesão do ligamento cruzado anterior sem contato (Hewett e Myer, 2011; Hewett e col., 2005). A lesão de ruptura do ligamento cruzado anterior tem destaque por acometer 4 a 6 vezes mais atletas mulheres que homens, (Hewett e col., 2006) e por acontecerem em maior parte em lances sem contato (Hewett, 2005; Hewett e col., 2011). Este panorama mostra que fatores intrínsecos estão mais associados à causa da lesão de ruptura do ligamento cruzado anterior, como por exemplo, a presença do padrão valgo do joelho (Hewett e col., 2005).

O teste *Lateral Step Down* avalia compensações de membros inferiores através da qualidade de movimento de descida do degrau, padrão que se assemelha muito com o agachamento unipodal. A qualidade do movimento é uma variável que pode ser caracterizada pelo comportamento, principalmente, de tronco, pelve e joelho ao longo da tarefa, e neste ponto o valgo dinâmico é um dos principais componentes analisados (Piva e col., 2006).

Rabin e Kozol (2010) estudaram mulheres saudáveis e sem lesão com o objetivo de determinar a associação entre amplitude de movimento de tornozelo e qualidade do movimento de membros inferiores durante o teste *Step Down*. Eles encontraram que a dorsiflexão de tornozelo reduzida está associada a baixa qualidade de movimento na tarefa de descida do degrau nessa população. Um estudo semelhante realizado por Rabin, Kozol e Spitzer (2014), desta vez aplicado a homens ativos, avaliou as mesmas variáveis - dorsiflexão de tornozelo e qualidade de movimento - e comparou o lado dominante e o não dominante. Os autores também encontraram que a amplitude de dorsiflexão foi mais limitada entre os participantes com qualidade moderada de movimento em ambos os lados (dominante e não dominante) quando comparado a participantes com boa qualidade de movimento na descida do degrau.

O valgo dinâmico do joelho também pode ser avaliado através do ângulo de projeção do joelho no plano frontal durante um agachamento unipodal, e foi assim que Wyndon e col. (2016) investigaram a relação desta variável com mobilidade do pé e do tornozelo em adultos assintomáticos. Encontraram associação significativa entre maiores ângulos de projeção de joelho no plano frontal com menor mobilidade de mediopé e de dorsiflexão de tornozelo. Rabin e col. (2016) que, ao avaliar a cinemática do quadril e do joelho em indivíduos com baixa dorsiflexão de tornozelo, encontraram maior adução de quadril nesta tarefa. Assim como uma acentuada adução do quadril na tarefa de descida do degrau também foi observada em mulheres saudáveis com amplitude de dorsiflexão reduzida em um estudo realizado por Bell-Jenje e col. (2016). Além de maior adução do quadril, outras compensações que favorecem o aparecimento do valgo dinâmico podem ser desencadeadas pela restrição na amplitude de movimento do tornozelo como pronação do pé e rotação interna da tíbia (Dill e col., 2014), acentuada rotação interna (Wyndow e col., 2016) e ainda queda da pelve (Rabin, Kozol e Moran, 2014).

Ainda, analisando de outro ponto de vista, o varo dinâmico do joelho é o movimento contrário ao valgo, sendo caracterizado pelo deslocamento lateral do joelho. Dill e col. (2014)

encontraram maior padrão varo do joelho no agachamento unipodal em indivíduos com maior dorsiflexão de tornozelo, em um estudo que teve como amostra adultos ativos. Estes achados complementam os mencionados aqui até então, visto que um determinado padrão varo tende a proteger o joelho de um acentuado deslocamento medial em tarefas dinâmicas.

A relação da diminuição da dorsiflexão e os mecanismos de compensação nos membros inferiores, caracterizando um valgo no joelho, foram identificados em população saudável e não esportiva e geram perda da qualidade de movimento em diversas tarefas diárias. A prática da atividade esportiva poderia levar a uma melhora desse padrão pela consciência corporal adquirida e pelo desenvolvimento de diversas valências físicas. No entanto, estudos envolvendo jogadoras de futebol também demonstraram associação do valgo dinâmico com diminuição de dorsiflexão do tornozelo. As lesões de joelho em jogadoras de futebol, sobretudo a ruptura de ligamento cruzado anterior, são o grande foco de estudos, devido a sua alta incidência nesta população (Crossley et al., 2020; Elsner et al., 2007; Junge e Dvorak, 2004 e 2010). Mecanismos que aumentem o risco para essa lesão são amplamente estudados na literatura, como o padrão de movimento de membros inferiores (Hewett e col., 2005), o controle neuromuscular e a carga em valgo (Hewett e col, 2006), a força da musculatura de quadril (Khayambashi e col., 2016) e a força de quadríceps e isquiotibiais (Myer e col., 2009). A análise específica entre as duas variáveis em questão - dorsiflexão de tornozelo e valgo dinâmico no joelho - em jogadoras de futebol ainda é pequena. Mecânicas de aterrissagem parecem ser mais estudadas, e podem contribuir para a presente discussão, pois o valgo dinâmico do joelho é um dos principais pontos a ser analisados em qualquer tipo de aterrissagem. Sigward e col. (2008) em um estudo aplicado a jogadoras de futebol em idade escolar (média de 15,5 anos), com o objetivo de determinar a associação entre ângulo de projeção do joelho no plano frontal durante o drop land (aterrissagem de queda a partir de uma caixa) com força da musculatura do quadril e amplitude de movimento de tornozelo e de quadril. Foi encontrado maior ângulo de projeção de joelho no plano frontal durante a

aterriagem em atletas com menor mobilidade de tornozelo e quadril, não sendo encontrado relação com força de quadril. Analisando jogadoras universitárias de futebol, Malloy e col. (2015) tiveram o objetivo de analisar se a amplitude de dorsiflexão influenciava na cinemática e na cinética de aterrissagem durante salto vertical. Os resultados demonstraram que as atletas com menor mobilidade de dorsiflexão tiveram maior abdução do joelho e menor pico de flexão do joelho, caracterizando o deslocamento medial da articulação, durante a aterrissagem.

Por fim, mesmo os estudos com atletas, incluindo atletas universitárias de futebol, encontraram resultados que vão ao encontro dos achados do presente estudo com atletas de futsal, reforçando a relação da presença do valgo dinâmico com a diminuição de amplitude de dorsiflexão do tornozelo. Em relação especificamente ao futsal, não foram encontrados estudos na literatura que relacionassem essas variáveis. Dessa forma, o presente estudo traz informações relevantes sobre o tema para esta modalidade esportiva.

Conclusão

Por meio do presente estudo é possível concluir que o padrão maior de valgo dinâmico durante a descida de um degrau tem significativa correlação com menores amplitudes de dorsiflexão de tornozelo em atletas universitárias de futsal feminino. Estes resultados sugerem que a avaliação da dorsiflexão do tornozelo é fundamental em atletas pela grande relação com um dos padrões que mais aumentam risco de lesão - valgo dinâmico. Por ser uma condição modificável, ao avaliar e criar estratégias que aumentem a mobilidade de dorsiflexão, os profissionais da área estarão atuando de maneira mais assertiva na redução do risco de lesões nessa população.

ANEXO I – Normas para submissão no Association of Chartered Physiotherapists in Sports Medicine (ACPSM)

DESCRIPTION

Physical Therapy in Sport is an international peer-reviewed journal that provides a forum for the publication of research and clinical practice material relevant to the healthcare professions involved in sports and exercise medicine, and rehabilitation. The journal publishes material that is indispensable for day-to-day practice and continuing professional development. Physical Therapy in Sport covers topics dealing with the diagnosis, treatment, and prevention of injuries, as well as more general areas of sports and exercise medicine and related sports science. The journal publishes original research, case studies, reviews, masterclasses, papers on clinical approaches, and book reviews, as well as occasional reports from conferences. Papers are doubleblind peer-reviewed by our international advisory board and other international experts, and submissions from a broad range of disciplines are actively encouraged.

GUIDE FOR AUTHORS

Your Paper Your Way

We now differentiate between the requirements for new and revised submissions. You may choose to submit your manuscript as a single Word or PDF file to be used in the refereeing process. Only when your paper is at the revision stage, will you be requested to put your paper in to a 'correct format' for acceptance and provide the items required for the publication of your article. To find out more, please visit the Preparation section below.

Types of paper

Original Research: Provide a full length account of original research and will not normally exceed 4000 words.

Review Papers: Provide an in-depth and up to date critical review of a related topic and will not normally exceed 4000 words.

Case Studies: A case report providing clinical findings, management and outcome with reference to related literature.

Masterclasses: Usually a commissioned piece by an expert in their field. If you would like to submit a non-commissioned article, please check with the editorial office beforehand. Please note Masterclass articles should be submitted as "Feature Article" on the Editorial system

These word counts include Keywords and the references contained within the article. The reference list at the end of the article, the Abstract, figures/tables, title and author information and Appendices are not included in the word count.

BEFORE YOU BEGIN

Ethics in publishing

Please see our information on Ethics in publishing.

If the work involves the use of animal or human subjects, the author should ensure that the work described has been carried out in accordance with The Code of Ethics of the World Medical Association (Declaration of Helsinki); Recommendations guiding physicians in biomedical research <http://www.wma.net/en/30publications/10policies/b3/index.html>. Adopted by the 18th World Medical Assembly, Helsinki, Finland, June 1964, amended by the 29th World Medical Assembly, Tokyo, Japan, October 1975, the 35th World Medical Assembly, Venice, Italy, October 1983, and the 41st World Medical Assembly, Hong Kong, September 1989. EU Directive 2010/63/EU for animal experiments http://ec.europa.eu/environment/chemicals/lab_animals/legislation_en.htm; Uniform Requirements for manuscripts submitted to Biomedical journals <http://www.icmje.org>. The manuscript should contain a statement that has been approved by the appropriate ethical committees related to the institution(s) in which it was performed and that subjects gave informed consent to the work. Studies involving experiments with animals must state that their care was in accordance with institution guidelines. Patients' and volunteers' names, initials, and hospital numbers should not be used. In a case report, the subject's written consent should be provided. It is the author's responsibility to ensure all appropriate consents have been obtained. Photographs of human participants are acceptable if the authors have received appropriate permission for publication of the photographs, or taken appropriate measures to disguise the individual's identity.

Informed consent and patient details

Studies on patients or volunteers require ethics committee approval and informed consent, which should be documented in the paper. Appropriate consents, permissions and releases must be obtained where an author wishes to include case details or other personal information or images of patients and any other

individuals in an Elsevier publication. Written consents must be retained by the author but copies should not be provided to the journal. Only if specifically requested by the journal in exceptional circumstances (for example if a legal issue arises) the author must provide copies of the consents or evidence that such consents have been obtained. For more information, please review the Elsevier Policy on the Use of Images or Personal Information of Patients or other Individuals. Unless you have written permission from the patient (or, where applicable, the next of kin), the personal details of any patient included in any part of the article and in any supplementary materials (including all illustrations and videos) must be removed before submission.

Declaration of interest

All authors must disclose any financial and personal relationships with other people or organizations that could inappropriately influence (bias) their work. Examples of potential competing interests include employment, consultancies, stock ownership, honoraria, paid expert testimony, patent applications/registrations, and grants or other funding. Authors must disclose any interests in two places: 1. A summary declaration of interest statement in the title page file (if double anonymized) or the manuscript file (if single anonymized). If there are no interests to declare then please state this: 'Declarations of interest: none'. 2. Detailed disclosures as part of a separate Declaration of Interest form, which forms part of the journal's official records. It is important for potential interests to be declared in both places and that the information matches. More information.

Submission declaration and verification

Submission of an article implies that the work described has not been published previously (except in the form of an abstract, a published lecture or academic thesis, see 'Multiple, redundant or concurrent publication' for more information), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere in the same form, in English or in any other language, including electronically without the written consent of the copyrightholder. To verify compliance, your article may be checked by Crossref Similarity Check and other originality or duplicate checking software. A Conflict of Interest file should be uploaded as a separate file during submission - see Conflict of Interest file section below for further details.

Use of inclusive language

Inclusive language acknowledges diversity, conveys respect to all people, is sensitive to differences, and promotes equal opportunities. Content should make no assumptions about the beliefs or commitments of any reader; contain nothing which might imply that one individual is superior to another on the grounds of age, gender, race, ethnicity, culture, sexual orientation, disability or health condition; and use inclusive language throughout. Authors should ensure that writing is free from bias, stereotypes, slang, reference to dominant culture and/or cultural assumptions. We advise to seek gender neutrality by using

plural nouns ("clinicians, patients/clients") as default/wherever possible to avoid using "he, she," or "he/she." We recommend avoiding the use of descriptors that refer to personal attributes such as age, gender, race, ethnicity, culture, sexual orientation, disability or health condition unless they are relevant and valid. When coding terminology is used, we recommend to avoid offensive or exclusionary terms such as "master", "slave", "blacklist" and "whitelist". We suggest using alternatives that are more appropriate and (self-) explanatory such as "primary", "secondary", "blocklist" and "allowlist". These guidelines are meant as a point of reference to help identify appropriate language but are by no means exhaustive or definitive.

Reporting sex- and gender-based analyses

Reporting guidance

For research involving or pertaining to humans, animals or eukaryotic cells, investigators should integrate sex and gender-based analyses (SGBA) into their research design according to funder/ sponsor requirements and best practices within a field. Authors should address the sex and/or gender dimensions of their research in their article. In cases where they cannot, they should discuss this as a limitation to their research's generalizability. Importantly, authors should explicitly state what definitions of sex and/or gender they are applying to enhance the precision, rigor and reproducibility of their research and to avoid ambiguity or conflation of terms and the constructs to which they refer (see Definitions section below). Authors can refer to the Sex and Gender Equity in Research (SAGER) guidelines and the SAGER guidelines checklist. These offer systematic approaches to the use and editorial review of sex and gender information in study design, data analysis, outcome reporting and research interpretation - however, please note there is no single, universally agreed-upon set of guidelines for defining sex and gender.

Definitions

Sex generally refers to a set of biological attributes that are associated with physical and physiological features (e.g., chromosomal genotype, hormonal levels, internal and external anatomy). A binary sex categorization (male/female) is usually designated at birth ("sex assigned at birth"), most often based solely on the visible external anatomy of a newborn. Gender generally refers to socially constructed roles, behaviors, and identities of women, men and gender-diverse people that occur in a historical and cultural context and may vary across societies and over time. Gender influences how people view themselves and each other, how they behave and interact and how power is distributed in society. Sex and gender are often incorrectly portrayed as binary (female/male or woman/man) and unchanging whereas these constructs actually exist along a spectrum and include additional sex categorizations and gender identities such as people who are intersex/have differences of sex development (DSD) or identify as non-binary. Moreover, the terms "sex" and "gender" can be ambiguous—thus it is important for authors to define the manner in which they are used. In addition to this definition guidance and the

SAGER guidelines, the resources on this page offer further insight around sex and gender in research studies.

Contributors

Those who meet some but not all of the criteria for authors can be identified as 'contributors' at the end of the manuscript with their contribution specified. All those individuals who provided help during the research (e.g., collecting data, providing language help, writing assistance or proofreading the article, etc.) that do not meet criteria for authorship should be acknowledged.

Authorship

All authors should have made substantial contributions to all of the following: (1) the conception and design of the study, or acquisition of data, or analysis and interpretation of data, (2) drafting the article or revising it critically for important intellectual content, (3) final approval of the version to be submitted.

In the covering letter to the editorial office, we ask you make a true statement that all authors meet the criteria for authorship, have approved the final article and that all those entitled to authorship are listed as authors.

Changes to authorship

Authors are expected to consider carefully the list and order of authors before submitting their manuscript and provide the definitive list of authors at the time of the original submission. Any addition, deletion or rearrangement of author names in the authorship list should be made only before the manuscript has been accepted and only if approved by the journal Editor. To request such a change, the Editor must receive the following from the corresponding author: (a) the reason for the change in author list and (b) written confirmation (e-mail, letter) from all authors that they agree with the addition, removal or rearrangement. In the case of addition or removal of authors, this includes confirmation from the author being added or removed. Only in exceptional circumstances will the Editor consider the addition, deletion or rearrangement of authors after the manuscript has been accepted. While the Editor considers the request, publication of the manuscript will be suspended. If the manuscript has already been published in an online issue, any requests approved by the Editor will result in a corrigendum.

New guidance for randomised controlled trials

Physical Therapy in Sport has adopted the proposal from the International Committee of Medical Journal Editors (ICMJE) (see a recent Editorial in Manual Therapy <http://www.sciencedirect.com/science/article/pii/S1356689X1200238X>, Editorial: "Clinical trial registration in physiotherapy journals: Recommendations from the International Society of Physiotherapy Journal Editors"), which requires, as a condition of consideration for publication of clinical trials, registration in a public trials registry. Trials must register at or before the onset of patient

enrolment. The clinical trial registration number should be included at the end of the abstract of the article. For this purpose, a clinical trial is defined as any research project that prospectively assigns human subjects to intervention or comparison groups to study the cause and effect relationship between a medical intervention and a health outcome. Studies designed for other purposes, such as to study pharmacokinetics or major toxicity (e.g. phase I trials) would be exempt. Further information can be found at <http://www.icmje.org>. Clinical Trials that commence after 1st June 2013 must be registered to be considered for publication in Physical Therapy in Sport. Authors will be asked to state the trial registration number during the submission system as well as at the end of the manuscript file. From January 2014 Physical Therapy in Sport will not be able to accept any unregistered Clinical Trial papers. By 2015 the journal will not be able to publish any Clinical Trials that are unregistered prior to recruitment of the first participant.

Reporting clinical trials (CONSORT)

Randomized controlled trials should be presented according to the CONSORT guidelines. At manuscript submission, it may be helpful to authors to complete the CONSORT checklist and flow chart. The CONSORT checklist and template flow diagram can be found on <http://www.consort-statement.org>. Authors should submit such files as "Supporting File" types at submission.

Article transfer service

This journal uses the Elsevier Article Transfer Service to find the best home for your manuscript. This means that if an editor feels your manuscript is more suitable for an alternative journal, you might be asked to consider transferring the manuscript to such a journal. The recommendation might be provided by a Journal Editor, a dedicated Scientific Managing Editor, a tool assisted recommendation, or a combination. If you agree, your manuscript will be transferred, though you will have the opportunity to make changes to the manuscript before the submission is complete. Please note that your manuscript will be independently reviewed by the new journal. More information.

Copyright

Upon acceptance of an article, authors will be asked to complete a 'Journal Publishing Agreement' (see more information on this). An e-mail will be sent to the corresponding author confirming receipt of the manuscript together with a 'Journal Publishing Agreement' form or a link to the online version of this agreement. Subscribers may reproduce tables of contents or prepare lists of articles including abstracts for internal circulation within their institutions. Permission of the Publisher is required for resale or distribution outside the institution and for all other derivative works, including compilations and translations. If excerpts from other copyrighted works are included, the author(s) must obtain written permission from the copyright owners and credit the source(s) in the article. Elsevier has preprinted forms for use by authors in these cases. For gold open access articles: Upon acceptance of an article,

authors will be asked to complete a 'License Agreement' (more information). Permitted third party reuse of gold open access articles is determined by the author's choice of user license.

Author rights

As an author you (or your employer or institution) have certain rights to reuse your work. More information. Elsevier supports responsible sharing Find out how you can share your research published in Elsevier journals.

Role of the funding source

You are requested to identify who provided financial support for the conduct of the research and/or preparation of the article and to briefly describe the role of the sponsor(s), if any, in study design; in the collection, analysis and interpretation of data; in the writing of the report; and in the decision to submit the article for publication. If the funding source(s) had no such involvement, it is recommended to state this.

Open access

Please visit our Open Access page for more information. Language (usage and editing services) Please write your text in good English (American or British usage is accepted, but not a mixture of these). Authors who feel their English language manuscript may require editing to eliminate possible grammatical or spelling errors and to conform to correct scientific English may wish to use the English Language Editing service available from Elsevier's Author Services.

Submission

Our online submission system guides you stepwise through the process of entering your article details and uploading your files. The system converts your article files to a single PDF file used in the peer-review process. Editable files (e.g., Word, LaTeX) are required to typeset your article for final publication. All correspondence, including notification of the Editor's decision and requests for revision, is sent by e-mail. *Submit your article*

Please submit your article via <https://www.editorialmanager.com/yptsp>

Referees

Please supply the names of two potential reviewers for your manuscript. Please provide their full name, position and e-mail address. Please do not suggest reviewers from your own institution, previous or current collaborators. Please note, the final choice of reviewers is that of the Editor and the journal reserves the right not to use reviewers which have been suggested by the authors.

Authors are required to submit manuscripts according to the requirements of this Guide for Authors. Please note that papers not formatted in this manner will be returned to the author for amendment

before entering into the editorial and peer review process. In particular please take care to follow the instructions for the formatting of references.

PREPARATION

Queries

For questions about the editorial process (including the status of manuscripts under review) or for technical support on submissions, please visit our Support Center.

NEW SUBMISSIONS

Submission to this journal proceeds totally online and you will be guided stepwise through the creation and uploading of your files. The system automatically converts your files to a single PDF file, which is used in the peer-review process. As part of the Your Paper Your Way service, you may choose to submit your manuscript as a single file to be used in the refereeing process. This can be a PDF file or a Word document, in any format or layout that can be used by referees to evaluate your manuscript. It should contain high enough quality figures for refereeing. If you prefer to do so, you may still provide all or some of the source files at the initial submission. Please note that individual figure files larger than 10 MB must be uploaded separately.

References

There are no strict requirements on reference formatting at submission. References can be in any style or format as long as the style is consistent. Where applicable, author(s) name(s), journal title/ book title, chapter title/article title, year of publication, volume number/book chapter and the article number or pagination must be present. Use of DOI is highly encouraged. The reference style used by the journal will be applied to the accepted article by Elsevier at the proof stage. Note that missing data will be highlighted at proof stage for the author to correct.

Formatting requirements

There are no strict formatting requirements but all manuscripts must contain the essential elements needed to convey your manuscript, for example Abstract, Keywords, Introduction, Materials and Methods, Results, Conclusions, Artwork and Tables with Captions. If your article includes any Videos and/or other Supplementary material, this should be included in your initial submission for peer review purposes. Divide the article into clearly defined sections.

If reporting exercise interventions for patellofemoral pain management (or even exercise intervention for other conditions) please consider reporting the intervention in line with the Report-PFP checklist see Report-PFP for details.

Figures and tables embedded in text

Please ensure the figures and the tables included in the single file are placed next to the relevant text in the manuscript, rather than at the bottom or the top of the file. The corresponding caption should be placed directly below the figure or table.

Within the manuscript authors should also ensure that the place of origin of the work or study, and/or the organization(s) that have been involved in the study/development (including ethical committees) are not revealed in the manuscript; the letter X can be used in the manuscript to replace names and details can be completed if the manuscript is processed further through the publication process.

Peer review

This journal operates a double anonymized review process. All contributions will be initially assessed by the editor for suitability for the journal. Papers deemed suitable are then typically sent to a minimum of two independent expert reviewers to assess the scientific quality of the paper. The Editor is responsible for the final decision regarding acceptance or rejection of articles. The Editor's decision is final. Editors are not involved in decisions about papers which they have written themselves or have been written by family members or colleagues or which relate to products or services in which the editor has an interest. Any such submission is subject to all of the journal's usual procedures, with peer review handled independently of the relevant editor and their research groups. More information on types of peer review.

Double anonymized review

This journal uses double anonymized review, which means the identities of the authors are concealed from the reviewers, and vice versa. More information is available on our website. To facilitate this, please include the following separately: Title page (with author details): This should include the title, authors' names, affiliations, acknowledgements and any Declaration of Interest statement, and a complete address for the corresponding author including an e-mail address. Anonymized manuscript (no author details): The main body of the paper (including the references, figures, tables and any acknowledgements) should not include any identifying information, such as the authors' names or affiliations.

REVISED SUBMISSIONS

Use of word processing software Regardless of the file format of the original submission, at revision you must provide us with an editable file of the entire article. Keep the layout of the text as simple as possible. Most formatting codes will be removed and replaced on processing the article. The electronic text should be prepared in a way very similar to that of conventional manuscripts (see also the Guide to Publishing with Elsevier). See also the section on Electronic artwork. To avoid unnecessary errors you are strongly advised to use the 'spell-check' and 'grammar-check' functions of your word processor.

Article structure

Presentation of manuscripts

All manuscripts must comply with the following:

- Your article should be typed on A4 paper, double-spaced with margins of at least 3cm

- Number all pages consecutively beginning with the title
- Include line counts on each page to facilitate the review process. page

Manuscripts

Each of the following sections should begin on a new page:

- a Title page (without author information)
- Abstract
- Keywords
- Text
- References
- Tables, Illustrations and Figures

Further instructions regarding the Text

- Do not use 'he', 'his' etc. where the sex of the person is unknown; say 'the participant', etc. Avoid inelegant alternatives such as 'he/she'. Avoid sexist language.
- Headings should be appropriate to the nature of the paper. The use of headings enhances readability.

Three categories of headings should be used:

1. major headings should be typed in capital letters in the centre of the page and underlined;
2. secondary headings should be typed in lower case (with an initial capital letter) at the left-hand margin and underlined; and
3. minor headings should be typed in lower case and italicized.

Essential Title Page information - a separate Title Page should be uploaded during submission.

- **Title.** Concise and informative. Titles are often used in information-retrieval systems. Avoid abbreviations and formulae where possible.
- **Author names and affiliations.** Please clearly indicate the given name(s) and family name(s) of each author and check that all names are accurately spelled. Present the authors' affiliation addresses (where the actual work was done) below the names. Indicate all affiliations with a lowercase superscript letter immediately after the author's name and in front of the appropriate address. Provide the full postal address of each affiliation, including the country name and, if available, the email address and twitter handle of each author.
- **Corresponding author.** Clearly indicate who will handle correspondence at all stages of refereeing and publication, also post-publication. **Ensure that the e-mail address is given and that contact details are kept up to date by the corresponding author.**
- **Present/permanent address.** If an author has moved since the work described in the article was done, or was visiting at the time, a 'Present address' (or 'Permanent address') may be indicated as a footnote to that author's name. The address at which the author actually did the work must be retained as the main, affiliation address.

Superscript Arabic

An numerals are used for such footnotes. Structured abstract An abstract of your manuscript, summarizing the content in no more than 200 words, should be provided. Abstracts should follow a structured format. For empirical studies, this will usually involve these headings: Objectives, Design, Setting, Participants, Main Outcome Measures, Results, Conclusions.

For Review articles, a structured abstract should contain the headings: Objective, Methods, Results and Conclusions. Authors are advised to refer to a recent example in the journal for further detail.

For Masterclass articles, a structured abstract giving a Basic Summary and purpose statement should be given, headings are not required - please see example below and recent Masterclass articles published in the journal.

Abstract

Articular cartilage is a unique biphasic material that supports a lifetime of compressive and shear forces across joints. When articular cartilage deteriorates, whether due to injury, wear and tear or normal aging, osteoarthritis and resultant pain can ensue. Understanding the basic science of the structure and biomechanics of articular cartilage can help clinicians guide their patients to appropriate activity and loading choices. The purpose of this article is to examine how articular cartilage structure and mechanics, may interact with risk factors to contribute to OA and how this interaction provides guidelines for intervention choices This paper will review the microstructure of articular cartilage, its mechanical properties and link this information to clinical decision making.

Highlights

Highlights are mandatory for original research and review papers; they are not required for any other article type. They consist of a short collection of 3 to 5 bullet points (maximum 85 characters, including spaces, per bullet point) that convey the core findings of the article. See <https://www.elsevier.com/highlights> for examples.

Keywords

Please list 3 or 4 keywords on the first page of your manuscript, after the Abstract. The purpose of these is to increase the likely accessibility of your paper to potential readers searching the literature. Therefore, ensure keywords are descriptive of the study. Refer to a recognised thesaurus of keywords (e.g. CINAHL, MEDLINE) wherever possible.

Acknowledgements

Please list those individuals who provided help during the research (e.g., providing language help, writing assistance or proof reading the article, etc.) Please do not include any acknowledgements within your main manuscript file until the revision stages, when it should be placed after the statement of Funding (see Conflict of Interest file section below).

Additional information required for Research articles, Reviews and Masterclass articles

Conflict of Interest file

A Conflict of Interest file is required and should include statements of (1) Conflict of Interest, (2) Ethical Approval and (3) Funding under these headings and in the order given here. If some, or all three, do not apply, please still include the headings stating "None" / "Not applicable". Clinical Trial Registry name and registration number and Acknowledgments may be added if applicable as 4th and 5th headings. For revised manuscripts this information must be transferred to the manuscript file, before the reference list, in the following order (please refer to a recent issue of the journal for examples): Conflict of Interest, Ethical Approval , Funding

Conflict of Interest

Any conflicts of interest should be stated here (please refer to *Declaration of Interest* section above). If there are no conflicts of interest please state "None declared".

Ethical Approval

A statement should be made that the work has been approved by the appropriate ethical committees related to the institution(s) in which it was performed and that subjects gave informed consent to the work. If Ethical Approval was not required please make a statement to this effect or state "None declared".

Funding

Funding sources should be noted at the end of the manuscript file. List funding sources in this standard way to facilitate compliance to funder's requirements:

This work was supported by XXXXX [grant numbers xxxx, yyyy]; XXXXX [grant number zzzz]; and XXXXX [grant number aaaa].

It is not necessary to include detailed descriptions on the program or type of grants and awards. When funding is from a block grant or other resources available to a university, college, or other research institution, submit the name of the institute or organization that provided the funding.

If no funding has been provided for the research, please include one of the following sentences:

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors

Or

None declared

Footnotes

Footnotes should be used sparingly. Number them consecutively throughout the article. Many word processors build footnotes into the text, and this feature may be used. Should this not be the case, indicate the position of footnotes in the text and present the footnotes themselves separately at the end of the article.

Artwork

Illustrations and tables that have appeared elsewhere must be accompanied by written permission to reproduce them from the original publishers. This is necessary even if you are an author of the

borrowed material. Borrowed material should be acknowledged in the captions in the exact wording required by the copyright holder. If not specified, use this style: 'Reproduced by kind permission of . . . (publishers) from . . . (reference).' **Identifiable clinical photographs must be accompanied by written permission from the patient.**

Electronic artwork

General points

- Make sure you use uniform lettering and sizing of your original artwork.
- Preferred fonts: Arial (or Helvetica), Times New Roman (or Times), Symbol, Courier.
- Number the illustrations according to their sequence in the text.
- Use a logical naming convention for your artwork files.
- Indicate per figure if it is a single, 1.5 or 2-column fitting image.
- For Word submissions only, you may still provide figures and their captions, and tables within a single file at the revision stage.
- Please note that individual figure files larger than 10 MB must be provided in separate source files.

A detailed guide on electronic artwork is available.

You are urged to visit this site; some excerpts from the detailed information are given here.

Formats

Regardless of the application used, when your electronic artwork is finalized, please 'save as' or convert the images to one of the following formats (note the resolution requirements for line drawings, halftones, and line/halftone combinations given below):

EPS (or PDF): Vector drawings. Embed the font or save the text as 'graphics'.

TIFF (or JPG): Color or grayscale photographs (halftones): always use a minimum of 300 dpi.

TIFF (or JPG): Bitmapped line drawings: use a minimum of 1000 dpi.

TIFF (or JPG): Combinations bitmapped line/half-tone (color or grayscale): a minimum of 500 dpi is required.

Please do not:

- Supply files that are optimized for screen use (e.g., GIF, BMP, PICT, WPG); the resolution is too low.
- Supply files that are too low in resolution.
- Submit graphics that are disproportionately large for the content.

Color artwork

Please make sure that artwork files are in an acceptable format (TIFF (or JPEG), EPS (or PDF), or MS Office files) and with the correct resolution. If, together with your accepted article, you submit usable color figures then Elsevier will ensure, at no additional charge, that these figures will appear in color online (e.g., ScienceDirect and other sites) regardless of whether or not these illustrations are reproduced in color in the printed version. **For color reproduction in print, you will receive information regarding the costs from Elsevier after receipt of your accepted article.** Please indicate

your preference for color: in print or online only. Further information on the preparation of electronic artwork.

Figure captions

Ensure that each illustration has a caption. A caption should comprise a brief title (not on the figure itself) and a description of the illustration. Keep text in the illustrations themselves to a minimum but explain all symbols and abbreviations used.

References

Citation in Text

Please ensure that every reference cited in the text is also present in the reference list (and vice versa). Avoid using references in the abstract. Avoid citation of personal communications or unpublished material. Citations to material "in press" is acceptable and implies that the item has been accepted for publication. Citation of material currently under consideration elsewhere (e.g. "under review" or "submitted") is not.

Web references

As a minimum, the full URL should be given and the date when the reference was last accessed. Any further information, if known (DOI, author names, dates, reference to a source publication, etc.), should also be given. Web references can be listed separately (e.g., after the reference list) under a different heading if desired, or can be included in the reference list.

Data references

This journal encourages you to cite underlying or relevant datasets in your manuscript by citing them in your text and including a data reference in your Reference List. Data references should include the following elements: author name(s), dataset title, data repository, version (where available), year, and global persistent identifier. Add [dataset] immediately before the reference so we can properly identify it as a data reference. The [dataset] identifier will not appear in your published article.

Preprint references

Where a preprint has subsequently become available as a peer-reviewed publication, the formal publication should be used as the reference. If there are preprints that are central to your work or that cover crucial developments in the topic, but are not yet formally published, these may be referenced. Preprints should be clearly marked as such, for example by including the word preprint, or the name of the preprint server, as part of the reference. The preprint DOI should also be provided.

Reference management software

Most Elsevier journals have their reference template available in many of the most popular reference management software products. These include all products that support Citation Style Language styles, such as Mendeley. Using citation plug-ins from these products, authors only need to select the appropriate journal template when preparing their article, after which citations and bibliographies will be automatically formatted in the journal's style. If no template is yet available for this journal, please follow the format of the sample references and citations as shown in this Guide. If you use reference

management software, please ensure that you remove all field codes before submitting the electronic manuscript. More information on how to remove field codes from different reference management software.

Reference formatting

There are no strict requirements on reference formatting at submission. References can be in any style or format as long as the style is consistent. Where applicable, author(s) name(s), journal title/ book title, chapter title/article title, year of publication, volume number/book chapter and the article number or pagination must be present. Use of DOI is highly encouraged. The reference style used by the journal will be applied to the accepted article by Elsevier at the proof stage. Note that missing data will be highlighted at proof stage for the author to correct. If you do wish to format the references yourself they should be arranged according to the following examples:

Reference Style

Text: Citations in the text should follow the referencing style used by the American Psychological Association. You are referred to the Publication Manual of the American Psychological Association, Sixth Edition, ISBN 978-1-4338-0561-5, copies of which may be ordered from <http://books.apa.org/books.cfm?id=4200067> or APA Order Dept., P.O.B. 2710, Hyattsville, MD 20784, USA or APA, 3 Henrietta Street, London, WC3E 8LU, UK.

Examples of in text references:

Single author (Graham, 2001)

Two authors (Geyer & Braff, 1999)

Three to six authors (Lehman, Stohr, & Feldon, 2000) for the first citation and (Lehman et al., 2000) for subsequent citations.

More than six authors (Karper et al., 1996)

Please separate references in the text in parentheses by using a semi-colon.

List: references should be arranged first alphabetically and then further sorted chronologically if necessary. More than one reference from the same author(s) in the same year must be identified by the letters 'a', 'b', 'c', etc., placed after the year of publication.

Examples of listed references:

Reference to a journal publication:

Herrington, L., and Munro, A. (2010). Drop jump landing knee valgus angle; normative data in a physically active population. *Physical Therapy in Sport*, 11, 56-59

Reference to a book:

Magee, D.J. (1997). Orthopaedic physical assessment. (3rd ed.). Philadelphia: Saunders.

Reference to a chapter in an edited book:

Hudson, Z., & Brown, A. (2003). Athletes with disability. In: G. S. Kolt, & L. Snyder-Mackler (Eds.), *Physical therapies in sport and exercise* (pp. 521-304). Edinburgh: Churchill Livingstone.

Example of data citation:

[dataset] Oguro, M., Imahiro, S., Saito, S., Nakashizuka, T. (2015). Mortality data for Japanese oak wilt disease and surrounding forest compositions. Mendeley Data, v1. <http://dx.doi.org/10.17632/xwj98nb39r.1>

Supplementary material

Supplementary material such as applications, images and sound clips, can be published with your article to enhance it. Submitted supplementary items are published exactly as they are received (Excel or PowerPoint files will appear as such online). Please submit your material together with the article and supply a concise, descriptive caption for each supplementary file. If you wish to make changes to supplementary material during any stage of the process, please make sure to provide an updated file. Do not annotate any corrections on a previous version. Please switch off the 'Track Changes' option in Microsoft Office files as these will appear in the published version.

Supplementary material should be uploaded at submission as "e-component" files.

Research data

This journal encourages and enables you to share data that supports your research publication where appropriate, and enables you to interlink the data with your published articles. Research data refers to the results of observations or experimentation that validate research findings. To facilitate reproducibility and data reuse, this journal also encourages you to share your software, code, models, algorithms, protocols, methods and other useful materials related to the project.

Below are a number of ways in which you can associate data with your article or make a statement about the availability of your data when submitting your manuscript. If you are sharing data in one of these ways, you are encouraged to cite the data in your manuscript and reference list. Please refer to the "References" section for more information about data citation. For more information on depositing, sharing and using research data and other relevant research materials, visit the research data page.

Data linking

If you have made your research data available in a data repository, you can link your article directly to the dataset. Elsevier collaborates with a number of repositories to link articles on ScienceDirect with relevant repositories, giving readers access to underlying data that gives them a better understanding of the research described.

There are different ways to link your datasets to your article. When available, you can directly link your dataset to your article by providing the relevant information in the submission system. For more information, visit the database linking page.

For supported data repositories a repository banner will automatically appear next to your published article on ScienceDirect.

In addition, you can link to relevant data or entities through identifiers within the text of your manuscript, using the following format: Database: xxxx (e.g., TAIR: AT1G01020; CCDC: 734053; PDB: 1XFN).

Data statement

To foster transparency, we encourage you to state the availability of your data in your submission. This may be a requirement of your funding body or institution. If your data is unavailable to access or unsuitable to post, you will have the opportunity to indicate why during the submission process, for example by stating that the research data is confidential. The statement will appear with your published article on ScienceDirect. For more information, visit the Data Statement page.

Submission Checklist

The following list will be useful during the final checking of an article prior to sending it to the journal for review. Please consult this Guide for Authors for further details of any item.

Ensure that the following items are present:

One author has been designated as the corresponding author with contact details:

- E-mail address
- Full postal address
- Phone numbers

All necessary files have been uploaded, and contain:

- Keywords
- All figure captions
- All tables (including title, description, footnotes)

Further considerations

- Manuscript has been 'spell-checked' and 'grammar-checked'
- References are in the correct format for this journal
- All references mentioned in the Reference list are cited in the text, and vice versa
- Permission has been obtained for use of copyrighted material from other sources (including the Web)
- Color figures are clearly marked as being intended for color reproduction on the Web (free of charge) and in print, or to be reproduced in color on the Web (free of charge) and in black-and-white in print
- If only color on the Web is required, black-and-white versions of the figures are also supplied for printing purposes For any further information please visit our customer support site at <https://service.elsevier.com>.

AFTER ACCEPTANCE

Online proof correction

To ensure a fast publication process of the article, we kindly ask authors to provide us with their proof corrections within two days. Corresponding authors will receive an e-mail with a link to our online proofing system, allowing annotation and correction of proofs online. The environment is similar to MS Word: in addition to editing text, you can also comment on figures/tables and answer questions from the Copy Editor. Web-based proofing provides a faster and less error-prone process by allowing you to directly type your corrections, eliminating the potential introduction of errors.

If preferred, you can still choose to annotate and upload your edits on the PDF version. All instructions for proofing will be given in the e-mail we send to authors, including alternative methods to the online version and PDF.

We will do everything possible to get your article published quickly and accurately. Please use this proof only for checking the typesetting, editing, completeness and correctness of the text, tables and figures. Significant changes to the article as accepted for publication will only be considered at this stage with permission from the Editor. It is important to ensure that all corrections are sent back to us in one communication. Please check carefully before replying, as inclusion of any subsequent corrections cannot be guaranteed. Proofreading is solely your responsibility.

Offprints

The corresponding author will, at no cost, receive 25 free paper offprints, or alternatively a customized Share Link providing 50 days free access to the final published version of the article on ScienceDirect. The Share Link can be used for sharing the article via any communication channel, including email and social media. For an extra charge, paper offprints can be ordered via the offprint order form which is sent once the article is accepted for publication. Corresponding authors who have published their article gold open access do not receive a Share Link as their final published version of the article is available open access on ScienceDirect and can be shared through the article DOI link.

AUTHOR INQUIRIES

Visit the Elsevier Support Center to find the answers you need. Here you will find everything from Frequently Asked Questions to ways to get in touch.

You can also check the status of your submitted article or find out when your accepted article will be published.
