**Supplementary Note Table 4. Associations of relative attribution of COSMIC mutational signatures with age-standardised**

Signature	Effect size (95% CI)	Regression type	p-value
SBS1	-0.0003 (-0.0008-0.0003)	linear	3.2e-01
<b>SBS40a</b>	<b>0.0043 (0.0016-0.0070)</b>	linear	<b>1.7e-03</b>
<b>SBS40b</b>	<b>0.0104 (0.0082-0.0125)</b>	linear	<b>1.1e-20</b>
ID1	-0.0024 (-0.0037--0.0010)	linear	5.1e-04
ID5	<b>0.0100 (0.0068-0.0132)</b>	linear	<b>1.2e-09</b>

Linear regressions are run with relative signature attribution as a dependent variable and ASR as an independent variable for all signatures p-values are shown for the ASR variable in linear regressions. Raw values are shown, i.e. without adjustment for multiple comparisons.

Covariates in all regressions include sex and age of diagnosis.

Results passing multiple comparisons are highlighted in bold.

## | incidence rates (ASR) of ccRCC

resent in >=75% of samples.

ID burden	20.49 (6.26-34.72)	linear	4.8e-03

Linear regressions were run with signature attribution or mutational burden as a dependent variable and ASR as an independent variable.

Countries with predominant AA signatures (Romania, Serbia and Thailand) were excluded.

If a signature was present in <75% of samples, the logistic regressions were used with signature presence as a dependent variable.

p-values are shown for the ASR variable in linear or logistic regressions. Raw values are shown, i.e. without adjustment for multiple comparisons.

Covariates in all regressions include sex and age of diagnosis.

The result for SBS12 is not representative due to the outlier effect of this signature in Japan.  
Results passing multiple comparisons are highlighted in bold.

**ndardised incidence rates (ASR) of ccRCC excluding countries with predominant AA signatures**

Logistic regressions with signature presence as a dependent variable, unless signature is present in >75% of samples in which case the above/below p-values are shown for the corresponding variables in logistic regressions. Raw values are shown, i.e. without adjustment for multiple comparisons. Covariates include sex, age of diagnosis, country of residence and tobacco smoking status.

Results passing multiple comparisons are highlighted in bold.

**for early-stage cases only**

low median approach is used.

3.

SV burden	-0.29 (-0.95-0.37)	linear	3.9e-01

Linear regressions are run with signature attribution or burden as a dependent variable and ASR as an independent variable if signature is p  
p-values are shown for the ASR variable in linear or logistic regressions. Raw values are shown, i.e. without adjustment for multiple compar  
Covariates in all regressions include sex and age of diagnosis.

Results passing multiple comparisons are highlighted in bold.

## **nutational burden with age-standardised incidence rates (ASR) of ccRCC**

present in >=75% of samples, otherwise the logistic regressions are used with signature presence as a dependent variable.  
sons.

**Supplementary Note Table 9. Associations of polygenic risk scores with age-standardised incidence rates (ASR) of ccRCC**

PRS instrument	Effect size (95% CI)	p-value
RCC risk	0.19 (-0.16-0.54)	3.0e-01
BMI	0.05 (-0.36-0.46)	8.0e-01
Systolic blood pressure	0.19 (-0.62-1.00)	6.4e-01
Diastolic blood pressure	0.17 (-0.47-0.81)	5.9e-01
Fasting glucose	-0.82 (-1.52--0.12)	2.2e-02
Fasting insulin	-0.42 (-4.11-3.27)	8.2e-01
Tobacco smoking	0.29 (-0.60-1.18)	5.3e-01

Linear regressions with ASR as a dependent variable and PRS as an independent variable.

p-values are shown for the PRS instruments in linear regressions. Raw values are shown, i.e. without adjustment for multiple comparisons.

Covariates include sex, age of diagnosis, and first five principal components of the genetic ancestry PCA.

No results pass the multiple comparisons.

**CC.**

**Supplementary Note Table 10. Intensity variability of 10 known compounds across all QC samples.**

Name	N	Mean	RSD
